Alabama Hunting Survey, 2013-2014 Season

There is a great demand for outdoor recreation in Alabama. Hunting makes up a significant portion of that demand and contributes greatly to the state's economy. Hunting seasons are scheduled each year for a wide variety of game animals. In order to make decisions to manage those animals it is necessary to gather as much information as practical concerning hunting activities.

Each year since 1963, the Alabama Division of Wildlife and Freshwater Fisheries has conducted a sample survey of licensed Alabama hunters to obtain information in the form of estimates for the number of hunters, man-days of hunting, and harvest levels for each of the game species. This year, survey forms were mailed to a stratified random sample of 10,344 drawn from the 263,419 Alabama hunting licensees. Of the 10,344 survey forms mailed, 658 or 6.36% were returned undeliverable. A total of 3,659 completed survey forms were returned (35.4%), (37.8%) of those delivered). A sample is used because it is not practical to contact all hunters each year. Because of this and other factors it is impossible to determine values that would be entirely free of error.

The estimates in this survey represent hunting by licensed hunters only, and do not include other legal hunting by hunters (i.e. those hunters not required to hold a license due to their age or because they hunt on their own property), nor do the estimates include illegal hunting without a license. Table 2 of this report indicates that 222,055 licensed individuals actually hunted in Alabama during the 2013-14 season. The 2011 National Survey of Fishing, Hunting and Wildlife Associated Recreation indicates approximately 535,000 residents (licensed and unlicensed) and non-residents hunted in Alabama. Of the 535,000 individuals that hunted in Alabama during 2011-2012 season, 249,686 were licensed. Comparison of those figures indicates that hunters who are not required to buy licenses contribute significantly to the overall hunting effort and harvest of game animals in this state.

In reviewing the current survey estimates, it is important to recognize that a degree of uncertainty must be associated with each of the estimates. This uncertainty is due to the estimates being based on a sample instead of a complete census of all licensed hunters. Consequently, each estimate for a hunting activity is likely to represent a value which deviates to some degree from the actual amount of hunting.

A measure of the degree of the uncertainty or "sampling error" associated with each estimate can be determined by analysis of the variability in the survey data. The statistical term for this measure is the "standard error" of the estimate. Standard errors tend to vary with the magnitude of their estimates and are difficult to use for general comparison of the level of uncertainty among estimates. A better index for judging the level of uncertainty is the relative standard error, i.e., the ratio of the standard error over the estimate. Relative standard errors, expressed on a percent basis, are provided in the tables along with the estimates and standard errors for this survey. An estimate with a low percent standard error is more reliable and has less uncertainty associated with it. Estimates with a percentage standard error less than 15% are reliable enough to be useful in making management decisions.

It is normal for the estimates to fluctuate considerably from one year to the next. Therefore, conclusions based on a single annual survey regarding the success of a particular season relative to another season may be misleading. However, comparing annual survey estimates over a number of years can be very useful for detecting trends that reflect real changes in hunting activity and harvest levels for a particular species. County level harvest information was extrapolated from the raw data and has a higher standard error due to smaller sample sizes than the statewide information.

The basic methods used to conduct and analyze the Alabama Hunting Survey were developed in the 1960's by statisticians with North Carolina State University. These statisticians specialized in research and surveys related to fish and wildlife. Minor changes were made periodically to keep the survey methods current. Beginning with the survey for the 2002-2003 hunting season, the data has been analyzed by personnel with Auburn University's School of Forestry and Wildlife Sciences. The methods now used to analyze data are similar; however, results have varied to the extent that direct comparisons to the results from hunting seasons prior to 2002-2003 may not be valid. Additionally, methods of analyzing the data were again adjusted by personnel with Auburn University's School of Forestry and Wildlife Sciences during the 2005-2006 survey in order to address issues identified by the Division of Wildlife and Freshwater Fisheries while working with surveys from 2003-2005. Those adjustments have resulted in more variations within the results that will be noticeable when examining trends in the estimates over the years. Methods for 2013-14 were consistent with methods used during the 2012-2013 season.

The Alabama Hunting Survey estimates are by no means the only source of information concerning wildlife management decisions, hunting, and game animal populations in this state. We gain much information from other research and surveys, public comments, nuisance wildlife complaints, crop damage reports, road kills, occurrence of disease and parasite problems, law enforcement reports, historical information, etc. All available information is considered in order to develop management programs that meet the needs of Alabama Wildlife resources and the people who enjoy them.

We extend our sincere appreciation to all hunters who participated in the Alabama Hunting Survey for the 2013-14 hunting season and in the surveys for earlier years.

This study was a contribution of the Alabama Division of Wildlife and Freshwater Fisheries supported in part by funding from the Federal Assistance in Wildlife Restoration Program, Project W-35, Study 6.

Feral Hogs	30,033	1,432	4.8	362,328	82,147	22.7	122,699	18,263	14.9

¹ Estimates for hunters in separate seasons (gun, archery and muzzleloader deer, 1st and remaining dove) do not sum to the combined estimate because each includes hunters participating in multiple seasons.

² Gun Deer Harvest – 43.0% Bucks / 57.0% Does. Archery Deer Harvest – 25.5% Bucks / 74.5% Does. Muzzleloader Deer Harvest – 25.8% Bucks / 74.2% Does. Combined Deer Harvest – 40.5% Bucks / 59.5% Does.

³ Harvest estimates are for the spring season only due to an extremely small number of fall turkey hunters in the sample and difficulty in extrapolating the numbers accurately to the hunting population. Based on the harvest data provided, approximately 13 turkeys were harvested legally in the 6 counties open to fall turkey hunting.

⁴ Spring Turkey Harvest – 98.0% Gobblers / 2.0% Jakes.

*Total number of hunters who hunted for that animal regardless of season. Many individuals hunt during more than one season.

Table 2. Results of Miscellaneous Questions Included on the Alabama Hunting Survey for the 2013-2014 Season

Questions ^a	Estimated Number of Hunters	Standard Error	Percent Standard Error	Percent of Respondents
^b Deer hunters only – Do you use a commercial vendor to process deer your harvest?				
	117,729	2,830	2.4	40.5
Explanation: 40.5% of the total survey respondents said they used a comercial vendor to process deer which translates into approximately 117,729 license purchasers.				
Number of license purchasers using deer processor = 117,729. There were 197,098 licensed deer hunters. Approximately 59.7% of deer hunters used a processor.				
^b To the best of your knowledge, does your primary hunting location have a feral pig population?				
	75,908	2,271	2.99	30.4
Turkey hunters only – Do you think the turkey population is increasing, decreasing, or the same in the county you primarily hunted?				
Increasing	20,713	1,181	5.7	6.6
Decreasing	23,914	1,288	5.38	8.8
Same	34,519	1,565	4.53	13.3
Hunted any game? Approximately 222,055 of the licensed hunters in Alabama hunted at least one day.				

^a Not all respondents filled out the miscellaneous questions.

^bThis is based on the respondent answering “yes”.

* Averaged Years

The 2013-2014 hunting season represents the third year the Division of Wildlife and freshwater Fisheries began collecting county deer and turkey harvest data through the annual hunter harvest mail survey. The following graphs represent estimated harvest numbers for the respective counties. In reviewing the current data, it is important to recognize that a degree of uncertainty must be associated with each of the estimates. Data provided by licensed hunters who stated they hunted in a given county were used to generate harvest estimates. Baldwin, Dallas, Jackson, Madison and other heavily hunted counties have lower standard errors because of the number respondents who hunted in those counties. Less heavily hunted counties have higher degrees of standard error (e.g.: Calhoun, Clay, Houston). Conclusions based on a single annual survey regarding the success of a particular season relative to another season may be misleading. However, comparing annual survey estimates over a number of years could be very useful for detecting trends that reflect real changes in hunting activity and harvest levels for a particular species and county.

Number of Bucks Harvested by County 2013-2014 Hunting Season

Number of Does Harvested by County 2013-2014 Hunting Season

*	Average of years					

The 2013-2014 hunting season represents the third year the Division of Wildlife and Freshwater Fisheries began collecting county deer and turkey harvest data through the annual hunter harvest mail survey. The following graph represent estimated harvest numbers for the respective counties. In reviewing the current data, it is important to recognize that a degree of uncertainty must be associated with each of the estimates. Data provided by licensed hunters who stated they hunted in a given county were used to generate harvest estimates. Baldwin, Choctaw, Jackson, Marengo, Wilcox, and other heavily hunted counties have lower standard errors because of the number of respondents who hunted in those counties. Less heavily hunted counties have higher degrees of standard error (eg: Colbert, Conecuh, Franklin). Small sample sizes of hunters indicating they harvested turkey in Cullman, Houston, Limestone, and other counties provided less than acceptable data to generate a harvest estimate for those counties. Conclusions based on a single annual survey regarding the success of a particular season relative to another season may be misleading. However, comparing annual survey estimates over a number of years could be very useful for detecting trends that reflect real changes in hunting activity and harvest levels for a particular species and county.
