Restoration Program, Alabama DJ/WB Project F-38*

Printed on Recycled Paper 

INTRODUCTION

In 1992 the B.A.I.T. program completed seven years of bass tournament summarization. The objective of the program has always been to gather information on bass populations by combining the efforts of bass club members and state fisheries biologists. The B.A.I.T. program summarizes catch data already being collected by participating clubs on reservoir bass populations. State fisheries biologists use the results in combination with data from other sources to base fisheries management decisions. Bass fishermen use the report to establish future tournament sites or to locate a reservoir that provides a particular type of fishing action.

Through 1992, 2,416 tournament reports were summarized. More than 150 clubs participated through the first seven years of the program. Bass fishermen have spent 65,878 angler-days and 642,056 hours collecting data for this program. They have contributed data from 162,280 bass that weighed 264,663 pounds.

METHODS

Every year an effort has been made to maintain the support of the previous years' clubs and to enlist the support of new clubs through news releases and letters. Participating club officers or tournament directors are sent the previous year's annual report, with tournament report postcards to be completed following each tournament. Clubs are assigned individual numbers to insure confidentiality. As tournament cards are received, they are checked for accuracy and entered into a computer database. Club officers are contacted when data are suspected to be erroneous. Compilation and analysis of the data are performed following receipt of December tournament data. Statewide information is sorted by reservoir, and by participating club. To rank reservoirs, five "fishing quality" indicators were used: percent of successful fishermen (percent of fishermen with one or more bass at weigh-in), bass average weight, number of bass per fisherman-day, pounds of bass per fisherman-day, and hours required to catch a bass five pounds or larger. Since the length of a fishing day varies between tournaments, a fisherman-day is defined as 10 hours of fishing effort. A minimum of five tournaments for an individual reservoir is considered necessary for minimum confidence in each reservoir dataset. Reservoirs with five or more tournament reports are ranked for each of the quality indicators. Values are assigned to each rank and an overall rank is determined for each reservoir by summing the values of the five quality indicators. This ranking system is intended to be a quick reference for club tournament site selection. It is not a "best and worst" list of Alabama reservoirs and should not be interpreted that way.

RESULTS AND DISCUSSION

Bass clubs submitted 428 tournament reports during 1992. Club representatives did an excellent job filling out the cards and few reports were rejected due to incomplete or erroneous information. Twenty eight more reports were received in 1992 than in 1991. Sixty seven clubs or tournament organizations provided data in 1992, seven more than in 1991. Eighty-five tournament reports from Alabama waters were received from Dr. Carl Quertermus of West Georgia College, who summarizes tournament data from the Georgia B.A.S.S. Federation. Without his support and the support of the Georgia Federation, several northeast Alabama reservoirs would not have been well represented, if at all, in the quality indicator ranking (Table 2). Once again we must stress that reports from more locations increase the capability of the summaries to reflect actual fish population conditions and not just a good or poor day's fishing by one or two clubs.

In 1992, tournament reports were received for 30 bodies of water that were fished 10,919 angler-days or 107,222 hours. B.A.I.T. anglers caught 27,725 bass (12 inches and larger) that weighed 46,724 pounds (Table 1). A total of 522 bass five pounds and larger were reported. The number of bass over 8.0 pounds in Table 5 was fewer than reported 1991 (18 in 1991 and 12 in 1992). Eight of the 12 fish were caught from reservoirs with Florida bass intergrade populations.

Statewide catch rates for number and pounds of fish have remained relatively high since 1989 (Figure 1). Natural fluctuations in bass abundance and size structure are the norm, since environmental conditions and fishing pressure vary from year to year.

Sixty seven clubs or tournament organizations submitted data during 1992. Twenty nine clubs submitted five or more tournament reports (43% of the clubs provided 84% of the data). Thirteen clubs submitted 10 or more reports, two less than last year (Table 3). Every year, lack of full reporting by participating clubs remains a limiting factor in this program. Twenty eight contributors submitted only one report. All club representatives should understand that every tournament report is important if this program continues to be successful. A list of clubs contributing tournament results for the 1992 B.A.I.T. report is presented in Table 4.

Creel limits that bass clubs impose are generally more conservative than the limits allowed by Game and Fish Division regulations. Only 13% of reporting clubs use the 10 fish limit per man allowed by state regulations, a decrease of 5% from last year. Twenty seven percent of reporting clubs are committed to daily creel limits of five fish or less per day, an increase of 5% from last year. The combination of these two statistics point to a more

conservative trend in use of creel limits by clubs. We commend any club that uses more conservative approaches to tournament creel limits in an effort to conserve our important fisheries resources.

More tournament reports were received from Martin (41) and Weiss (33) than any other locations. Eufaula, Jordan, Wheeler, Lay, Logan Martin, Harris and Guntersville each had 20 or more tournament reports (Table 1). Distribution of tournament reports across reservoirs improved slightly from last year. A good distribution of reports provides more representative catch statistics from which meaningful summaries can be prepared. The B.A.I.T. program has always needed more reports from Bankhead, Cedar Creek, Coffeeville, Harding, Holt, Smith, Tuscaloosa, Warrior, and Wilson. We request that B.A.I.T. club members solicit the support of all clubs that fish these waters.

Of the 30 reservoirs from which reports were received, 24 had five or more tournament reports (5 more than last year). The following comments deal with these 24 reservoirs (Table 2). The percent of successful fishermen (those with one or more fish) ranged from 45 at Eufaula to 91 at Millers Ferry. The average weight of bass caught ranged from 1.19 at Tuscaloosa to 2.40 at West Point (16-inch size limit)(Table 1). The statewide average weight was 1.69 pounds and has remained approximately the same since 1989. Catch rates ranged from 1.37 at Eufaula to 3.89 at Martin. The statewide average was 2.59 bass per fisherman-day, similar to the last two year's values. Catch rate expressed as pounds per fisherman-day ranged from 2.36 at Tuscaloosa to 5.92 at Lay. The statewide average was 4.36, a slight increase over the last two year's values.

Overall, Jordan was judged the top-ranked reservoir in Alabama, replacing Millers Ferry from last year. Jordan accumulated a total score of 99 of a possible 120 points (Table 2). Harding ranked second with 92 points and Millers Ferry slipped from first to third place. Eight points separated the first three reservoirs.

However, the intent of Table 2 is not to determine the overall "best" reservoir, but to characterize the fishery of each reservoir. As an example, look at the rankings for Martin. It produces high numbers of fish but of relatively low average weight. This results in a high ranking for pounds per fisherman-day, the measure most important at weigh-in. Is this good fishing? It depends on who you ask. If you want big fish, Martin is probably not the place to go, but if you want to catch good numbers of fish, its one of the best.

Our studies have isolated the factor responsible for the low average weight at infertile reservoirs like Martin. These fish are not smaller in

length than at other reservoirs. They are simply not as fat because infertile lakes grow less of the basses preferred food; shad.

Eufaula is a reservoir that exhibits distinct cycles in bass abundance. It ranked last in 1986, jumped to the top position from 1987 through 1989. It then fell to third in 1990, eighth in 1991 and slipped to twentieth this year. The first two years of the decline recorded little change in quality indicator values. Other lakes simply recorded higher values and pushed Eufaula down in the ratings. However, this year a marked decline in indicator values occurred, suggesting it is at or near the bottom of its cycle. These cycles are the reason the 16 inch size limit was imposed in July 1992. When bass are abundant no size limit is needed but when they are scarce the remaining fish need protection. We anticipate that over the years the size limit will moderate the cycles, resulting in more consistent fishing.

Another interesting point relates to the only other reservoir with a 16 inch size limit; West Point. Two clubs in the B.A.I.T. program fish West Point using a 12 inch size limit. Only fish larger than 16 inches are brought to the weigh-in, but fish between 12 and 16 inches are measured and released immediately. Their lengths are then converted to weights based on a standard equation. One of the clubs likes this approach so much that they use it wherever they fish, because they handle far fewer fish at weigh-in.

The West Point results for these clubs provide information that can be compared directly to other Alabama reservoirs. They caught 5.15 bass per fisherman-day that weighed an estimated 9.80 pounds. These values far exceed the catch rates for any other reservoir.

This year we have included a graphical catch summary for each body of water. The graphs in Appendix A provide you with a historical record of how your favorite waters have performed in the B.A.I.T. program since 1986. A couple words of caution, these graphs are not restricted to bodies of water with five or more tournaments. Data points for some years may be represented by only one tournament. However, those situations are restricted to those waters that generally have not been included in the quality indicator rankings. Secondly, when comparing water bodies, be aware that the scale on the vertical axes have maximum ranges that vary from four to seven units. You can use these graphs to predict 1993 fishing by looking for trends. For instance, Eufaula fishing probably will not improve drastically over 1992 results, if at all. However, Jordan fishing will probably be at least as good as 1992 and maybe better. You can also gain an appreciation for the magnitude and duration of cycles of bass abundance. Comparing Eufaula to Wheeler, Eufaula is functioning on a 6 or 7 year cycle, whereas, Wheeler cycles in 3 years.
