and Natural Resources

Funded in part by the Federal Aid  
in Sport Fish Restoration Program  
under DJ/WB Project F-38,  
Alabama

## INTRODUCTION

The B.A.I.T. program began in 1986 with the objective of gathering information on bass populations and their utilization by fishermen in Alabama reservoirs through the combined efforts of bass club members and state fisheries biologists. Reservoir creel surveys are expensive to conduct and cannot be undertaken on a statewide basis. The B.A.I.T. program was initiated to compile catch data on bass populations that were already being collected by the clubs.

The 1986 and 1987 reports contained records from 260 and 382 tournaments, respectively. Forty two clubs participated in 1986 and 59 supplied data in 1987. Twenty eight reservoirs were fished 52,161 hours by 5,212 fishermen the first year while 39 locations were fished 87,856 hours by 8,894 fishermen the second year.

## METHODS

During 1988, an effort was made to maintain the support of the 1986 and 1987 clubs and to enlist the support of clubs not in the program. Club officers or tournament directors were sent the 1987 Annual Report and postcards to be completed following each 1988 tournament. Each club was assigned a number to insure confidentiality. As the 1988 tournament cards were received by the Fisheries Section, they were checked for accuracy and entered into a computer database. Club officers were contacted when data

were suspected to be erroneous. Compilation and analysis of the data were performed following receipt of the December tournament data. Statewide information was sorted by reservoir, by month, and by participating club. A minimum of five tournaments for an individual reservoir was considered necessary for minimum confidence in each reservoir dataset. To rank reservoirs, five "fishing quality" indicators were used: percent successful fishermen (percent with at least one fish at weigh-in); bass average weight; number of bass per fisherman-day; pounds of bass per fisherman-day; and hours required to catch a bass of five pounds or larger. Since the length of a fishing day varies between tournaments, a fisherman-day was defined as 10 hours of fishing. Reservoirs for which five or more tournament reports were received were ranked for each of the quality indicators. Values were assigned to each rank and an "overall" rank was determined for each reservoir by summing the values for the five quality indicators. This ranking system is intended to be a quick reference for tournament site selection. It is not a "best" and "worst" list and should not be interpreted that way.

Last year a questionnaire was sent to all clubs participating in the program asking if club members would be willing to supply more detailed information about the lengths of fish caught and species composition of the catch. Twenty-eight clubs replied and most indicated a willingness to provide additional information. Based on that positive response, the 1988 B.A.I.T. tournament report postcard was amended to include blanks for numbers of bass caught by length group and by species. The

additional information requested was optional. Clubs that could not provide the length-by-species information were requested to continue providing basic tournament data.

## RESULTS AND DISCUSSION

Three hundred and seven (307) reports for 1988 tournaments were submitted by bass clubs. The club representatives did an excellent job filling out the cards and no reports were rejected due to incomplete or erroneous information. The number of tournament reports was 74 less than in 1987. Participating clubs declined from 59 in 1987 to 50 in 1988 and this probably had the greatest effect on the lower number of tournament reports. The 1987 E.A.I.T. Report indicated that fishing was excellent in 1987. Statewide summaries for 1988 reveal that fishing was even better in 1988 (Table 1 and Figure 1). The report covered 35 bodies of water which were fished 76,525 hours by 8,119 fishermen. They caught 20,687 bass (12 inches and larger) that weighed 31,724 pounds (Table 1). Two hundred and sixty-five (265) bass five pounds and larger were reported. Two bass greater than 10 pounds were reported. The largest bass, 12 pounds 4 ounces was caught on March 12 during a Uniroyal-Goodrich club tournament on West Point. The second largest fish was caught from Eufaula on September 18 during the Muscogee Sertoma open tournament.

Twenty-seven clubs (54%) submitted five or more tournament reports (34% of the clubs provided 59% of the data). Eleven clubs submitted 10 or more reports (Table 3). The Guntersville Bassmasters, Kowaliga Bassmasters, and Tom Mann's Fish World provided data on thirteen tournaments. As in 1987, lack of full reporting by clubs remains the limiting factor in this program. All clubs should understand that reports are needed for each of their tournaments. A list of 1988 B.A.I.T. clubs is presented in Table 6.

Most clubs used the standard 12-inch size limit (96%) except when fishing West Point where a 16-inch minimum size limit is in effect. Seventy percent of all reporting clubs used daily creel limits other than the state regulation of 10 bass per fisherman per day. The 7-bass-per-day limit used in Bass Angler Sportsman Society (B.A.S.S.) sponsored tournaments was used by 46% of the clubs. Lesser numbers of clubs used limits of 3, 5, 6, or 8 bass per day. The Pickwick Smallmouth Bass Club uses a 14-inch minimum size limit and a 3 fish per fisherman daily creel limit when fishing for smallmouth on Pickwick. Overall, clubs were more conservative in their tournament regulations than the limits allowed by Game and Fish Division regulations. Several clubs have committed to daily creel limits of five fish or less (14% of all tournaments) and size limits greater than 12 inches. These clubs should be commended for their efforts to conserve bass resources of the State.

To provide additional information for the clubs, the data was compiled by month (Table 4). Fishing was best in the spring and fall, although fairly productive in all seasons. Several clubs fished at night rather than during the day. Night tournaments represented 9% of all tournaments reported and were held from March through August.

Thirteen tournaments were major open tournaments or sponsored tournaments. Four tournaments each were held on Eufaula and the Mobile Delta. Two were held on Jones Bluff and one tournament each was held on Jordan, Martin, and Demopolis.

More tournament reports were received from Eufaula (40) than any other location. The Mobile Delta had 33 reports, Miller's Ferry reports totalled 27, and 22 tournaments were reported from Logan Martin (Table 1). Reports from these four locations represented 39% of all reports received.

Twenty-one reservoirs had five or more tournament reports of the 35 reservoirs for which reports were received. The following comments deal with these 21 reservoirs only (Table 2). Percent of successful fishermen ranged from 37 at West Point to 88 at Harris. West Point has been the lowest ranked reservoir in this category since 1986, but it is the only reservoir with a 16-inch size limit.

The average weight of bass harvested ranged from 1.33 pounds at Smith to 3.27 pounds at West Point (Table 1). The statewide average was 1.53 pounds. In addition to West Point, two other reservoirs, Jordan and Harding, reported average weights greater than two pounds. Harding is on the Chattahoochee River, where

the natural influence of Florida bass genetics is greater than on any other river system in the State. Jordan is a fertile, dynamic reservoir on the Coosa River system.

Catch rates ranged from a high of 4.26 bass per man-day at Eufaula to 0.63 at West Point. The statewide average was 2.70 bass per man-day an increase of 0.42 bass per man-day over last year. Catch in pounds per man-day ranged from a high of 6.99 at Eufaula to 2.05 at West Point. The statewide average was 4.15, an increase of 0.43 pounds per man-day. Ten locations had catches in excess of 4.0 pounds per man-day. Six were reported last year. Eufaula again lead all reservoirs in the catch of bass larger than five pounds, although the total dropped from 163 in 1987 to 85 in 1988.

Overall, Eufaula was judged the top ranked reservoir in Alabama for the second year, accumulating a total score of 95 of a possible 105 (Table 2). Gainesville and Miller's Ferry tied for second and Harris placed fourth with a score of 73.

Twelve clubs provided length frequency data on tournament catches. Those clubs providing this additional information are to be commended for their increased support of this program. Results of this effort are presented in Table 5. In addition to those locations presented, length data was also received from Bankhead, Demopolis, Eufaula, Gainesville, Harding, Jordan, Weiss, and Warrior. These data were not included because of incomplete entries, too few clubs reporting, or too few fish caught to develop a representative length frequency. To use Table 5, select a location and check the various size groups for

catch rates and percent. For example, a club considering a tournament on Gunter'sville could expect 57% of their catch to be less than 12 inches, 40% of the catch would be 12-15 inches, and 3% would be 15-20 inches. They could expect to catch bass 12-inches or larger at a rate of 2.44 fish per man-day ( $2.26 + 0.18$ ). This effort should continue with greater input from more clubs. Fisheries biologists and tournament fishermen will both benefit from summaries of the length data.
