

Endothall

Endothall is a fast-acting, contact herbicide that stops plant protein synthesis. Endothall effectively controls many submersed as well as some emersed plants. Endothall will kill many terrestrial plants that it contacts along the pond bank. Endothall is relatively inexpensive and is often substituted for diquat to control several submersed and emersed plants. The addition of a surfactant is recommended when treating emersed plants. Some formulations of endothall also offer control of many filamentous algae. A granular form is also available for situations where liquid application is difficult. Always refer to the product label for correct application instructions and precautions. The percentage of active ingredient located on the front of the label should be considered when comparing product brands. Product manufacturers can be contacted for more technical information or to find a local distributor. Below is a list of popular brands of endothall that are approved for aquatic use:

Brand Name	Form	Manufacturer	Contact Number	Email
Aquathol K	Liquid	Cerexagri-Nisso	1-800-438-6071	www.cerexagri-nisso.com
Aquathol Super K	Granular	Cerexagri-Nisso	1-800-438-6072	www.cerexagri-nisso.com
Hydrothol 191*	Liquid or Granular	Cerexagri-Nisso	1-800-438-6073	www.cerexagri-nisso.com

* also controls filamentous algae

Below is a list of potentially problematic plants observed in your pond on _____ that can be controlled with endothall:
